*Making Connections: Trends & Tempos in
Clinical Informatics & Professional Practice*

**Big Data, Cognitive Computing and the Impact
on Clinical Decision Support**

May 31st, 2015

V2.0

Three IT shifts are candidates to enable healthcare transformation - enabling a “Clinic without Walls” – a future based on ‘extended reach’, ‘vertical integration’ and ‘smarter care’.

Data is the new basis of strategic advantage

Data is becoming the world’s new natural resource, transforming industries and professions.

Cloud is the path to new business models

The emergence of cloud is transforming IT and business processes into digital services.

Engagement requires a systematic approach

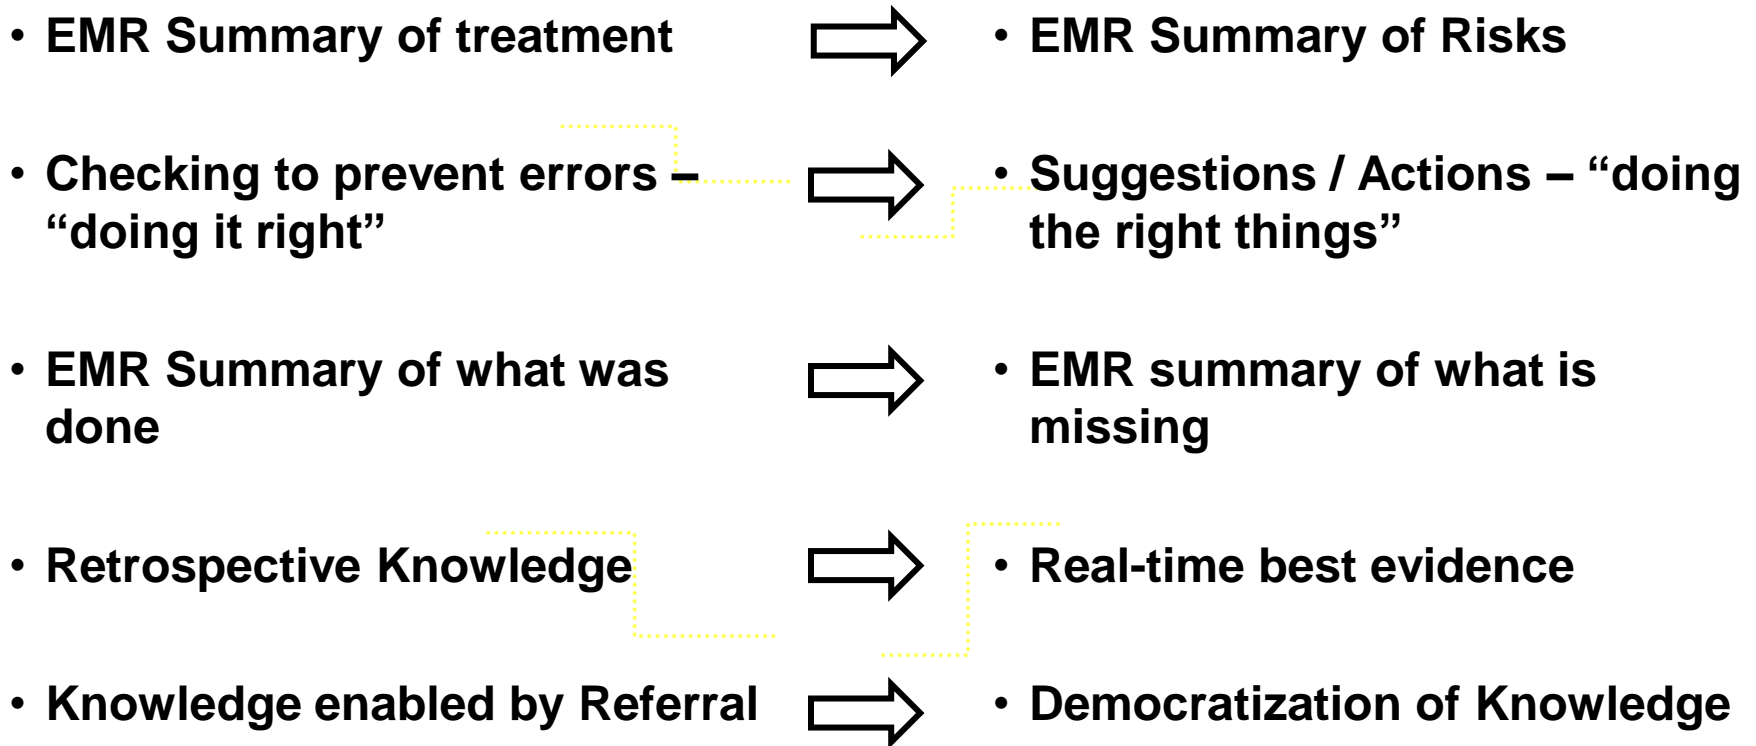

Mobile is transforming individual engagement – increasing ability to deliver value via “extended reach”.

Create a new vision for health systems – Systems of Insight and Engagement are mandatory to complement our investments in “Systems of Record” ..

Systems of Insight – analytic capabilities and health data scientists will redefine Clinical Decision Support.

Agenda

- **Shifting Sands – Healthcare and Big Data**
- **Knowledge and Data-driven Analytics**
- **Watson and Emergence of Cognitive Computing**
- **Discussion**

Global trends are forcing integration of health care and social services delivery – and segmentation of populations based on social determinants of health.

Aging Population

66%

2 million aged over 65 in UK will lack informal care from adult offspring by 2030...a 66% increase from 1.2 million in 2012

Increasing Costs

\$7 trillion+

The cost for health and social programs worldwide – health is 50% of Ontario's budget squeezing out other programs

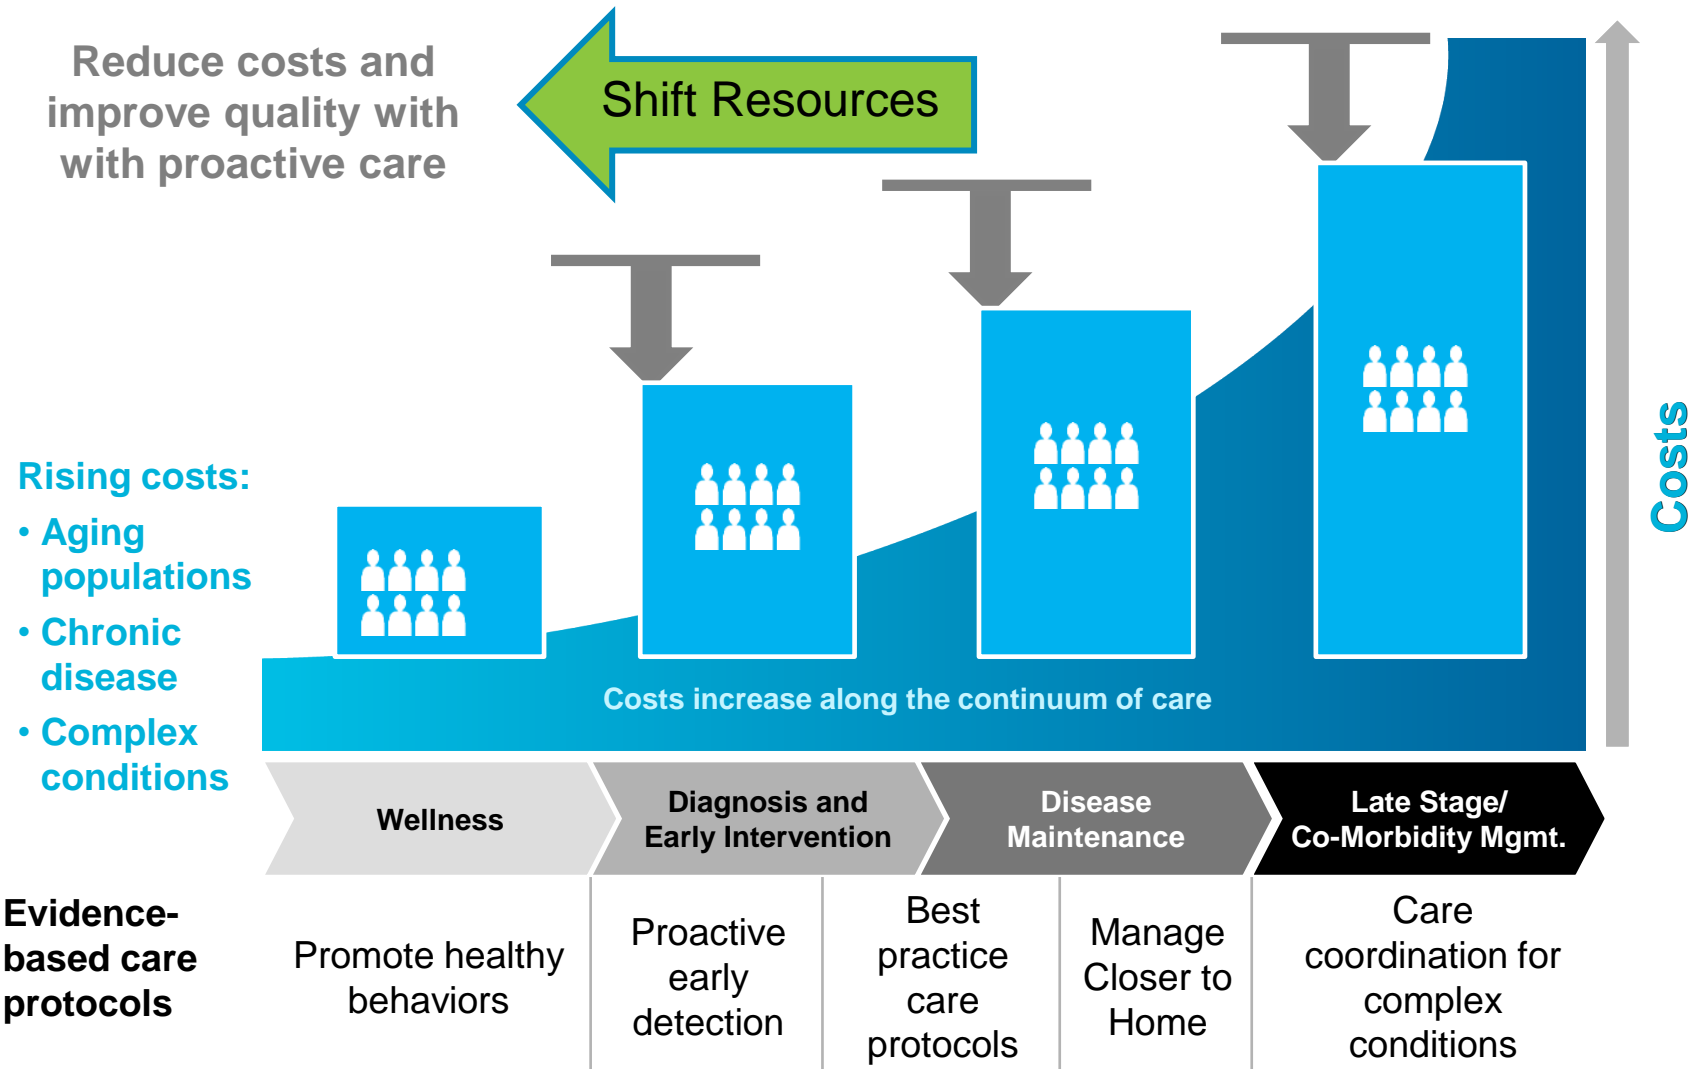

Chronic Disease

1 out of 4

1 in 4 Canadians – and 2 of 3 over the age of 65 – have multiple chronic conditions. 5% of Ontario patients consume 66% of health costs

Health ecosystems are responding to be more proactive, driving the need to identify patients at risk, and intervene in time.

Evidence-based care protocols

Path Toward Personalized Medicine

Understanding
the structure of
genomes

Understanding

Health data from new sources is exploding – and forcing reconsideration of investments that are aligned with future potential

Exogenous determinants

60%

Impact on individual health from behavior and environment

1,100 Terabytes

Generated per lifetime

Volume, Variety, Velocity, Veracity

Fitbits, Home Monitoring Systems, Educational records, Employment Status, Social Security accounts, Mental Health records, Caseworker files and more...

Genomic determinants

30%

Impact on individual health

6 TB

Generated per lifetime
Volume

Clinical determinants

10%

Impact on individual health

0.4 TB

Generated per lifetime
Variety

For Healthcare, harnessing Data as a new 'natural resource' to strategic advantage means managing the 'Four Vs'.

Volume

Data at Rest

Terabytes to exabytes of existing data to process

Velocity

Data in Motion

Streaming data, 1000's per millisecond with seconds to respond

Variety

Data in Many Forms

Structured, unstructured, text, multimedia

Veracity

Data in Doubt

Data inconsistency & incompleteness, ambiguities, latency, deception, model approximations

Agenda

- **Shifting Sands – Healthcare and Big Data**
- **Knowledge and Data-driven Analytics**
- **Watson and Emergence of Cognitive Computing**
- **Discussion**

Systems of Insight have the potential to redefine clinical decision support in the context of both Knowledge-driven and Data-driven Analytics.

Knowledge-Driven

■ Published Knowledge

- Journals
- Books
- Guidelines

- Discovery Advisor
- Oncology Advisor
- Engagement Advisor
- Clinical Trials Matching
- EMR Assist
- Genomics Advisor

Data-Driven

■ Observational Data

- Longitudinal records
- Claims, Rx, Labs
- Genomics
- Exogenous

- Patient similarity
- Predictive modeling
- Real World Evidence
- Genomics
- Visual analytics

Insights also means moving from retrospective to predictive – e.g. monitoring of premature infants - predicting onset 24 hrs in advance.

- Research Project between University of Ontario Institute of Technology (UOIT) & IBM Research - Monitors infants in the Hospital for Sick Children NICU
- Manages 100's data values per second – applies context and evidence-based rules
- Measures trends in multiple readings and based on combination of subtle changes, predicts adverse event 24 hours before onset.

Insight means leveraging clinical notes - extraction of 'data' from non-structured text to structured factors via Watson NLP.

Watson's Text Analytics Natural Language Processing

- Manages abbreviation, negation, ambiguous phrases
 - "55%" = LVEF**
 - "Patient does not show signs" = Negative Symptom**

Pre-built Watson Annotators for Care Management

- Infer meaning from non-contextual content
 - "Cut back from two packs to one per day" = Smoker**
- Identify, normalize, and code medical and social facts in unstructured content including:
 - Diagnosis, procedure, allergy, medication, labs, lifestyle

A 42-year old male presents for a physical. He lives alone and recently cut back from 2 packs to 1 pack per day. He recently had a right hemicolectomy invasive grade 2 (of 4) adenocarcinoma in the ileocecal valve was found and excised. At the same time he had an appendectomy. The appendix showed no diagnostic abnormality.

Patient	Age: 42 Gender: Male Smoker: Yes Living Arrangements: Alone
Hx Procedure	hemicolectomy diagnosis: invasive adenocarcinoma anatomical site: ileocecal valve grade: 2 (of 4)
Hx Procedure	appendectomy diagnosis: normal anatomical site: appendix

For example, using both structured and non-structured data, a predictive model identifies patients at risk for developing CHF.

9000 patients

identified for at-risk care management program

Improves

patient satisfaction and delays or prevents chronic disease onset

Reduces

Costs of care management through prioritization of resources

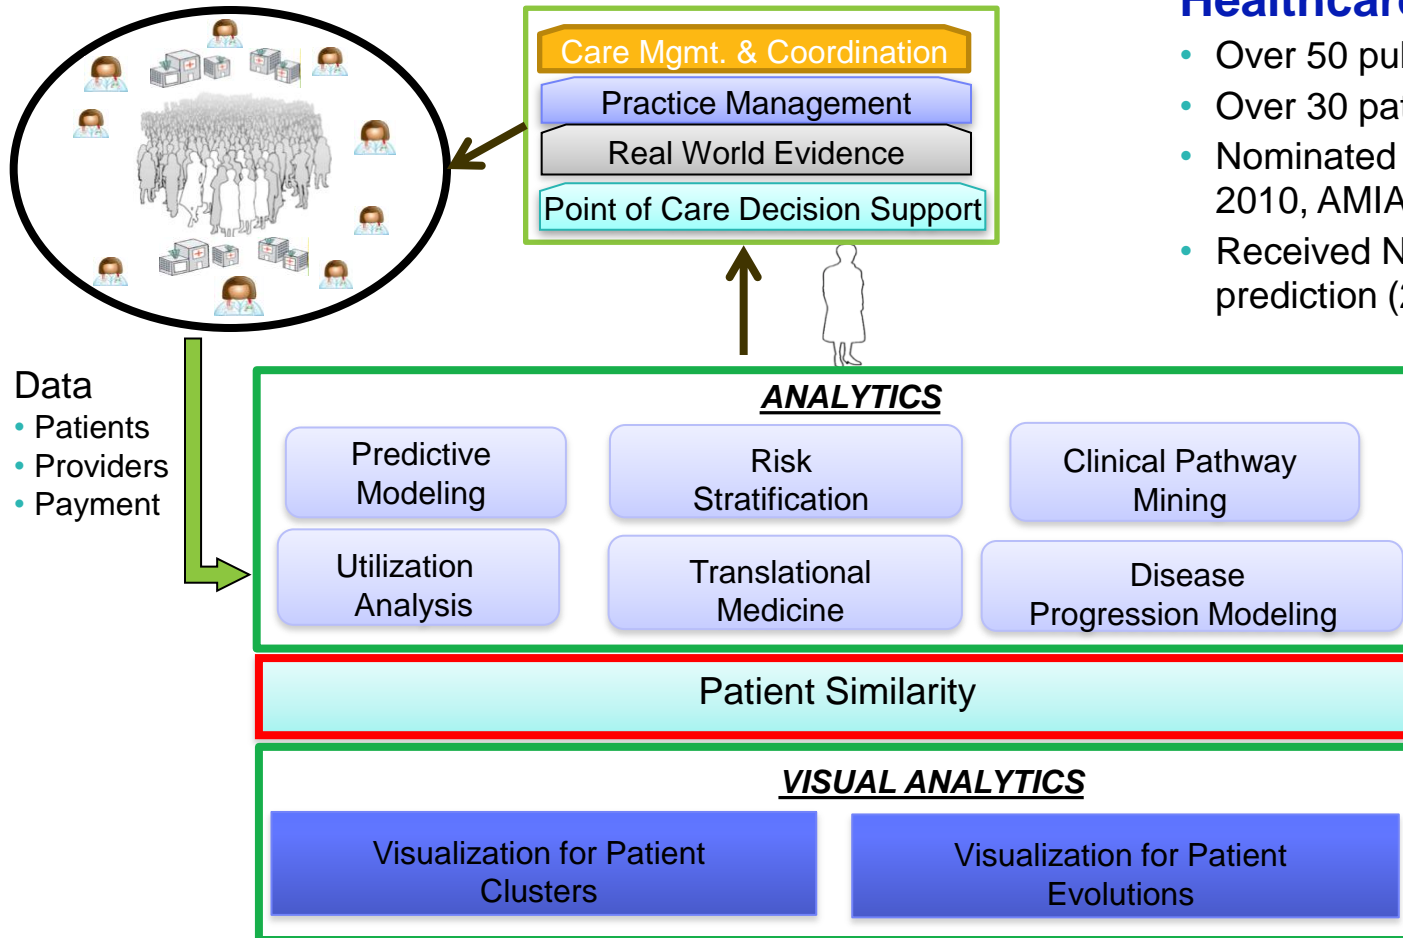

Business Challenge: The problem is identifying those patients at risk before the onset of the disease and before diagnosis so that preventative steps can be taken.

The Smarter Solution: IBM built and deployed a predictive model that achieved an **accuracy score of 85%** in its ability to **identify those patients at risk for developing CHF in a 1 year timeframe.**

The model leveraged structured data from the EPIC EMR system and also incorporated unstructured clinical notes that helped the model better identify patients with the condition, increasing its accuracy

Systems of Insight and Data-driven Healthcare Analytics means Building Capabilities.

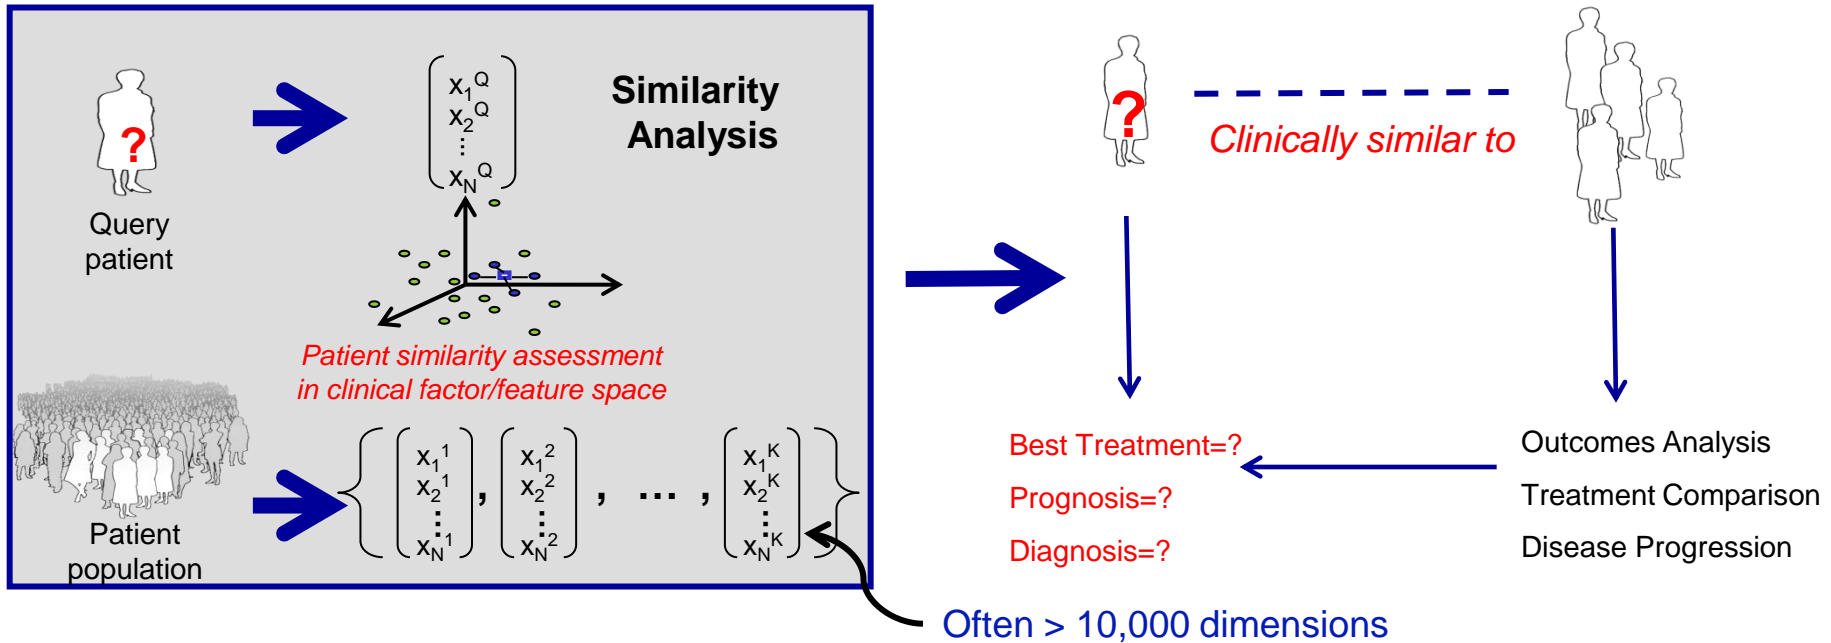

Data Driven Healthcare Analytics Framework

IBM's Track Record in Healthcare Analytics

- Over 50 publications in 4 years
- Over 30 patents filed
- Nominated for best paper: AMIA 2010, AMIA Summit 2014
- Received NIH grant for CHF prediction (2013 – 2016)

Large Scale Patient Similarity Analysis

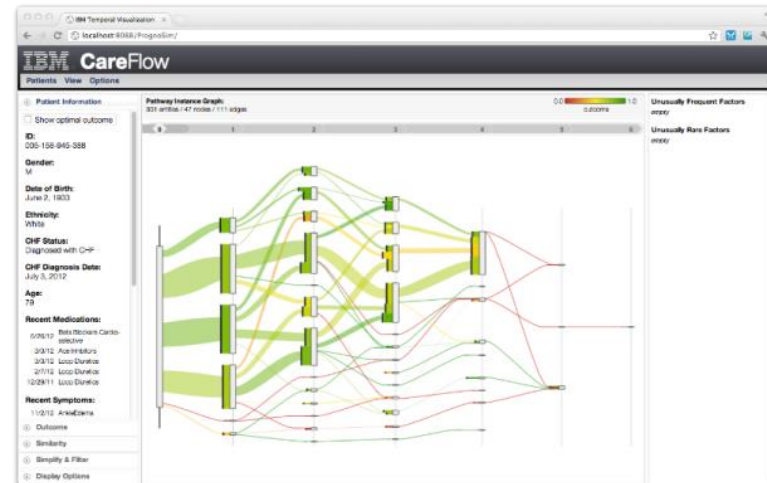

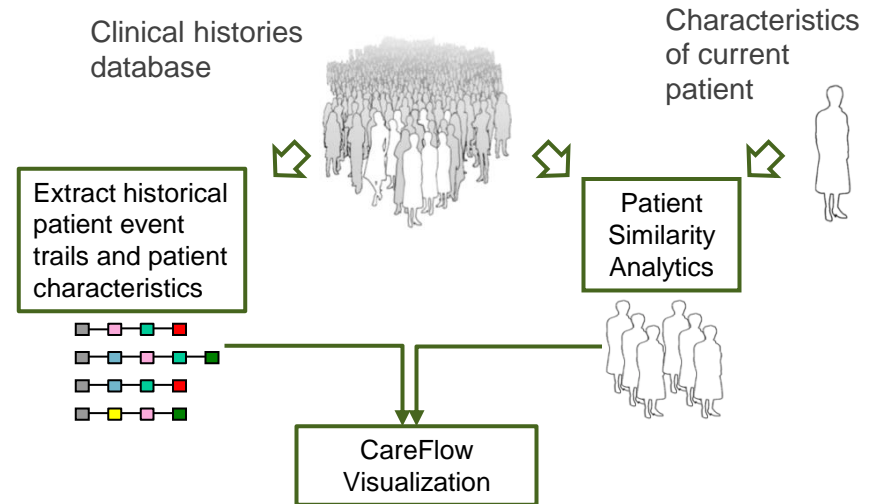

Challenge: identify the measure of clinical similarity between patients

Approach: machine learning algorithms to automatically learn the best metric from observational data and labels provided by experts or derived from data

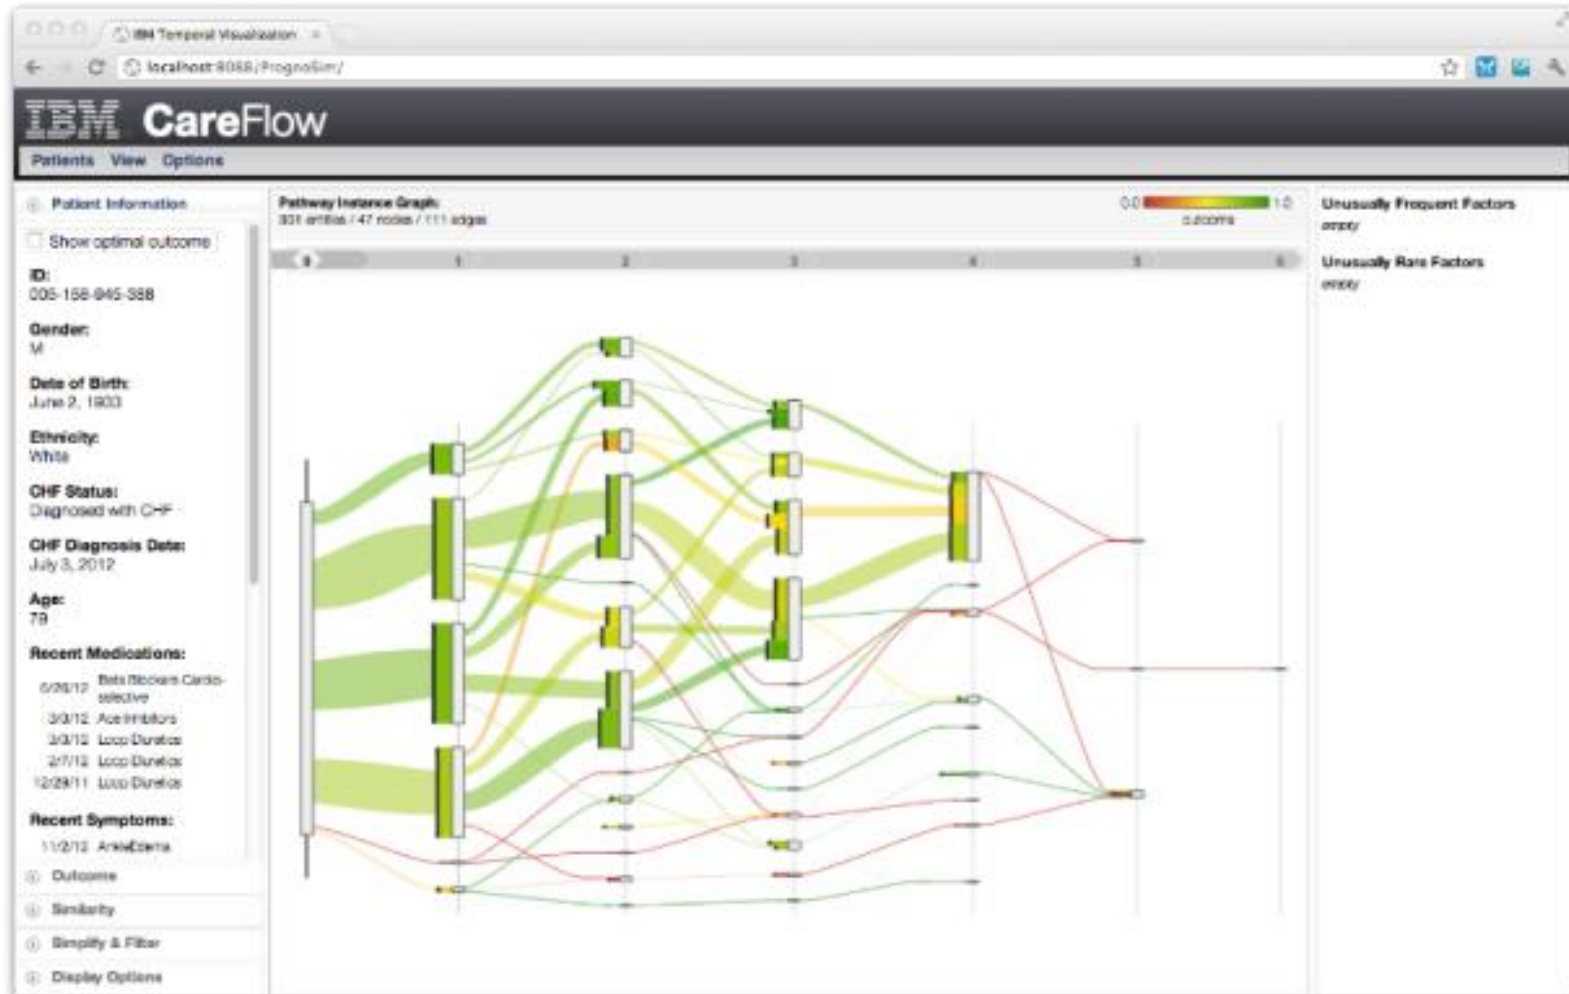

IBM Research has evolved a Decision Support Tool for Clinical Care – visualizes what happened to patients “just like yours”

• Key capabilities

- Uses Patient Similarity Analytics to find clinically similar patients.
- Extracts historical event trails and patient characteristics relevant to the condition targeted
- Provides a Visual Summary of the evolution of clinical pathways of the similar patients, based on relevant to events
- Relates outcomes to pathways, to help identifies most desirable and most problematic pathways to inform clinical decisions

IBM Research has evolved a Decision Support Tool for Clinical Care – visualizes what happened to patients “just like yours”

Transforming Skin Cancer Detection using Data-Driven Learning

Today

Diagnosis

Transformation 1 (Current)

Computer Assisted Diagnosis

Transformation 2 (Future)

Diagnosis and Continuous Learning

Manual Inspection

ABCDE
Asymmetry
Borders
Color
Diameter
Evolution

Computer Analysis

Ensemble Classification

Segmentation and Visual Feature Extraction

Deep Learning

Convolutional Neural Network (CNN)
 Discrimination and Feature Learning

Unknown Images

Unknown Images

Unknown Images

- Inaccurate Diagnoses from Limited Samples and Modalities
- Subjective Evaluation

- Higher Accuracy (1K's training)
- Improved Consistency
- More Contextual Data (modalities)

- Highly Accurate (1M's training)
- Continuous Learning from Data
- High Density Samples (space/time)

Manual Data-Driven

Using Systems of Insight to “know your customers” – segment patients – similar to Catalunya, Spain who have risk profiled based on 8 Clinical Risk Groups.

Agenda

- **Shifting Sands – Healthcare and Analytics**
- **Knowledge and Data-driven Analytics**
- **Watson and Emergence of Cognitive Computing**
- **Discussion**

Knowledge-driven Analytics – and emergence of Cognitive Computing – Learning Systems - to address the challenges of healthcare

- Watson focuses on “Knowledge Management”
 - EMR investments focus on record management
- 800,000 publications per year catalogued by the US Library of Medicine

Starting in 2006, our investments have led to Watson for Healthcare - integration of knowledge with data to drive better decisions and outcomes.

1 Understands natural language and human speech

2 Generates and evaluates hypothesis for better outcomes

3 Adapts and Learns from user selections and responses

Watson's Cognitive Computing capabilities allows you to Ask, Discover, and Decide.

DECIDE

Watson Oncology

to assist in identifying individualized treatment plans and clinical trials..

IBM Watson for Oncology Trained by Memorial Sloan Kettering

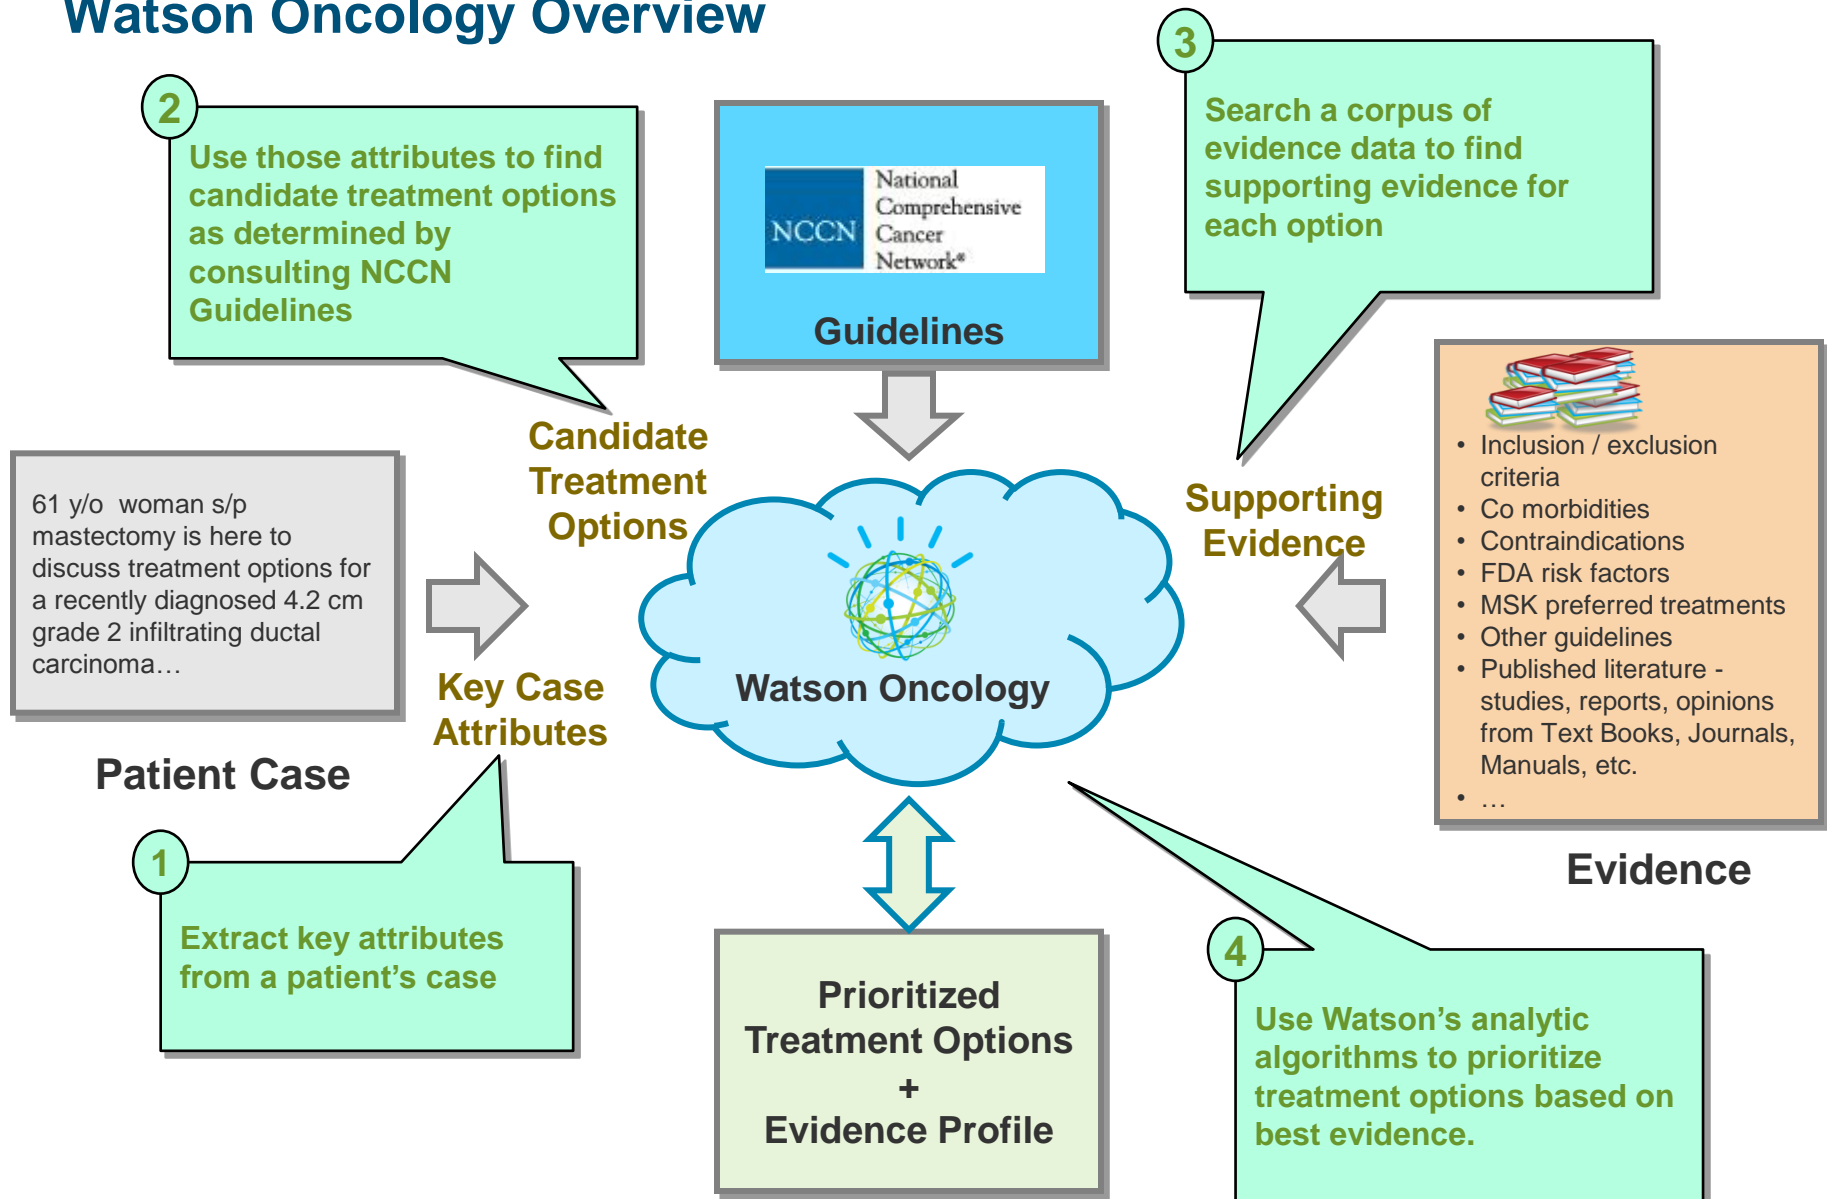

Business challenge:

- Ability to assess quickly the best treatments for an individual patient based on latest evidence and clinical guidelines

Watson solution:

- A tool to assist physicians make personalized treatment decisions
 - Analyzes patient data against thousands of historical cases and trained through thousands of Memorial Sloan Kettering MD and analyst hours
 - Suggestions to help inform oncologists' decisions based on over 290 medical journals, over 200 textbooks, and 12M pages of text
 - Evolves with the fast-changing field
 - Currently supports first line treatment (Breast, Lung, Colorectal cancers)

Adjuvant Therapy for completely resected Stage II Colon Cancer

Alvaro Figueredo, Megan E Coombes, Som Mukherjee. Adjuvant Therapy for completely resected Stage II Colon Cancer. Cochrane Database of Systematic Reviews. 2008 Jul.

Relevance: ■ ■ ■ Strength: ■ ■ ■

Adjuvant therapy for completely resected stage II colon cancer Colon cancer is the second most common cause of cancer deaths in the Western world. A large proportion of colon cancer patients can be cured by surgical resection alone. For those patients with lymph node positive (stage III) disease, the recurrence rate can exceed 50% and adjuvant chemotherapy has been shown to significantly reduce the risk of recurrence. In patients without lymph node involvement (stage I and II), the prognosis is quite good with surgery alone, with survival rates of 75% to 95% at 5 years. However, some patients with high risk stage II disease have a relapse rate approaching that of stage III colon cancer patients. Due to the effectiveness of systemic chemotherapy in stage III disease, a similar approach has been considered for patients with stage II disease. We performed a systematic review looking at all randomized clinical trials evaluating stage II colon cancer patients and adjuvant therapy versus surgery alone. Our review found that adjuvant therapy -either systemic or regional chemotherapy or immunotherapy- can improve the outcomes of stage II patients. In counselling individual patients, the advice given should be conditioned by the patient's age and comorbidities. In addition, the high risk features of the tumour should also be considered when contemplating the benefits of systemic therapy in patients with stage II colon cancer. Further investigation is needed to elucidate which patient and tumour factors can be used to select stage II colon cancer patients for adjuvant therapy. There also exists a need to continue to search for other adjuvant therapies which might be more effective, shorter in duration and less toxic than those available today.

Jeffrey W Clark, Axel Grothey. UptoDate. 2012 Jan.

Relevance: ■ ■ ■ Strength: ■ ■ ■

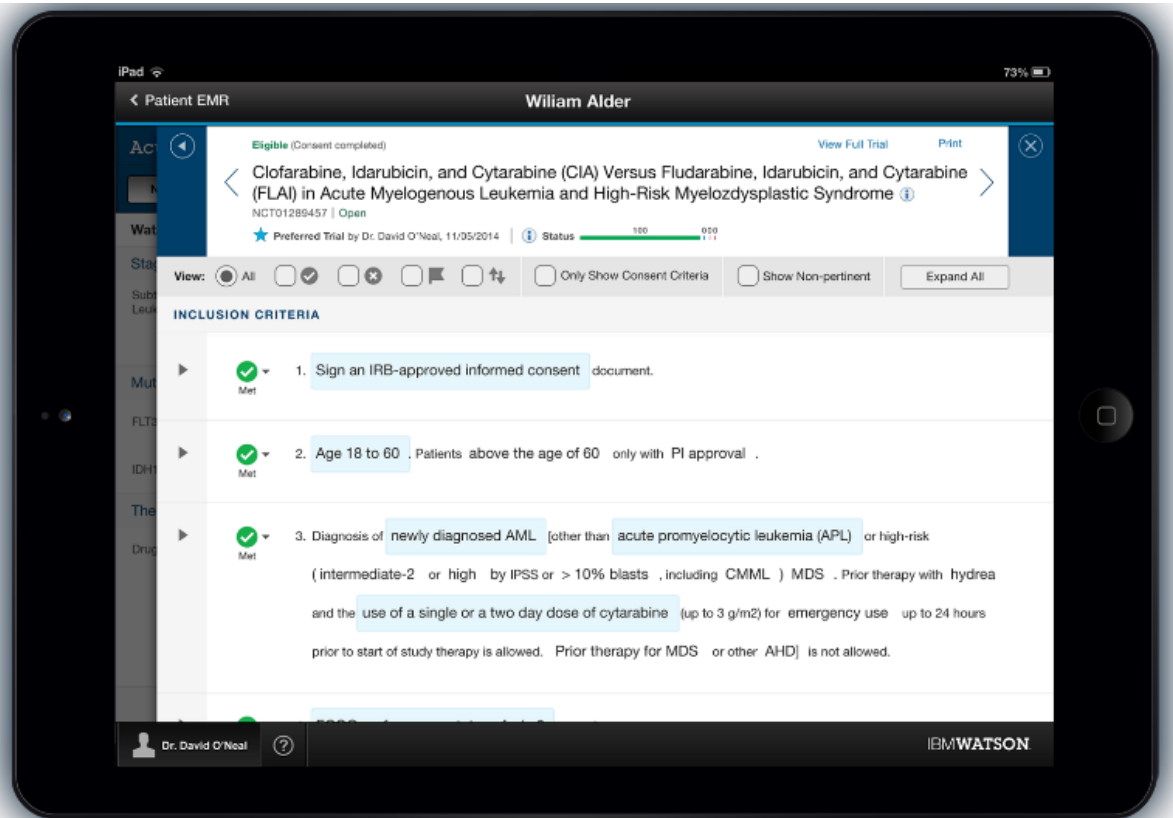

Clinical Trial Matching is being used by The Mayo Clinic to increase participation rates in clinical trials.

Business challenge:

- Clinicians have **no easy way to search across eligibility criteria** of relevant clinical trials for their patient;
- 30% of sites for clinical trials fail in enrolling even a single patient

Watson solution:

- Use patient data to **instantly check eligibility** across all relevant clinical trials

Department of Veterans Affairs will assess Watson technology in pilot study that could benefit 8.3 million veterans requiring care each year

Challenges

The amount of medical data doubles every three years

Size and complexity associated with patient data in EMRs is overwhelming

The potential of EMRs has not been realized given the discrepancies of how the data is recorded, collected and organized across healthcare systems

Success Value

Watson will make it possible for VHA physicians to interact with medical data in natural language, process millions of pages of patient information and medical literature to uncover patterns and insights, and learn from each interaction. By sifting through reams of clinical data, Watson is able to distill evidence and knowledge within seconds.

During the pilot, Watson will base clinical decisions on realistic simulations of patient encounters – pre-visit, visit and post-visit situations.

“Physicians can save valuable time finding the right information needed to care for their patients with Watson technology...A tool that can help a clinician quickly collect, combine and present information will allow them to spend more time listening and interacting with the Veteran.” –Carolyn Clancy - Interim Undersecretary for Health - VA

New York Genome Center and IBM Watson launched an initiative to accelerate a new era of genomic medicine

Challenges

As the cost of Next Generation Sequencing decreases, there will be an increase in tumor genome sequencing resulting in massive quantities of genetic data to analyze

It can take on an average from 4-6 weeks to analyze and interpret genetic data manually

Complexity of matching genetic mutations of individual's tumor with molecular targeted therapies using multiple data sources

Success Value

"With this [genomics] knowledge, doctors will be able to attack cancer and other devastating diseases with treatments that are tailored to the patient's and disease's own DNA profiles. This is a major transformation that can help improve the lives of millions of patients around the world."

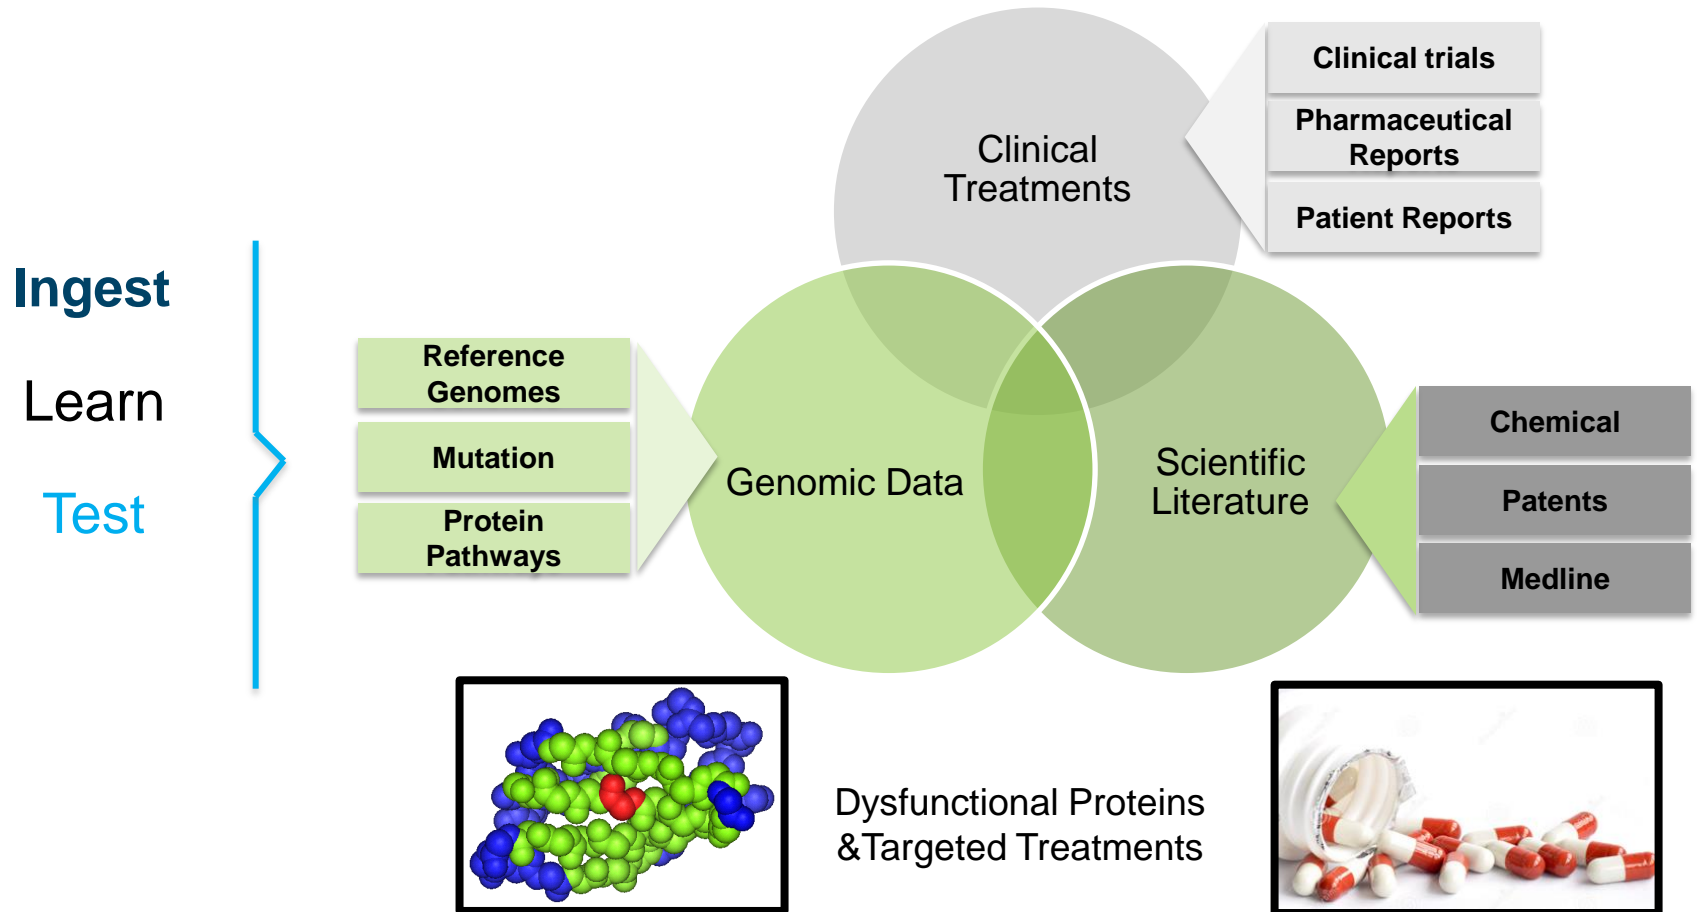

– Dr. John E. Kelly, Senior Vice President, Solutions Portfolio & Research

Secured Beta testing relationships with 13 Cancer and Academic medical centers

“Applying the cognitive computing power of Watson is going to revolutionize genomics and accelerate the opportunity to improve outcomes for patients with deadly diseases by providing personalized treatment.”

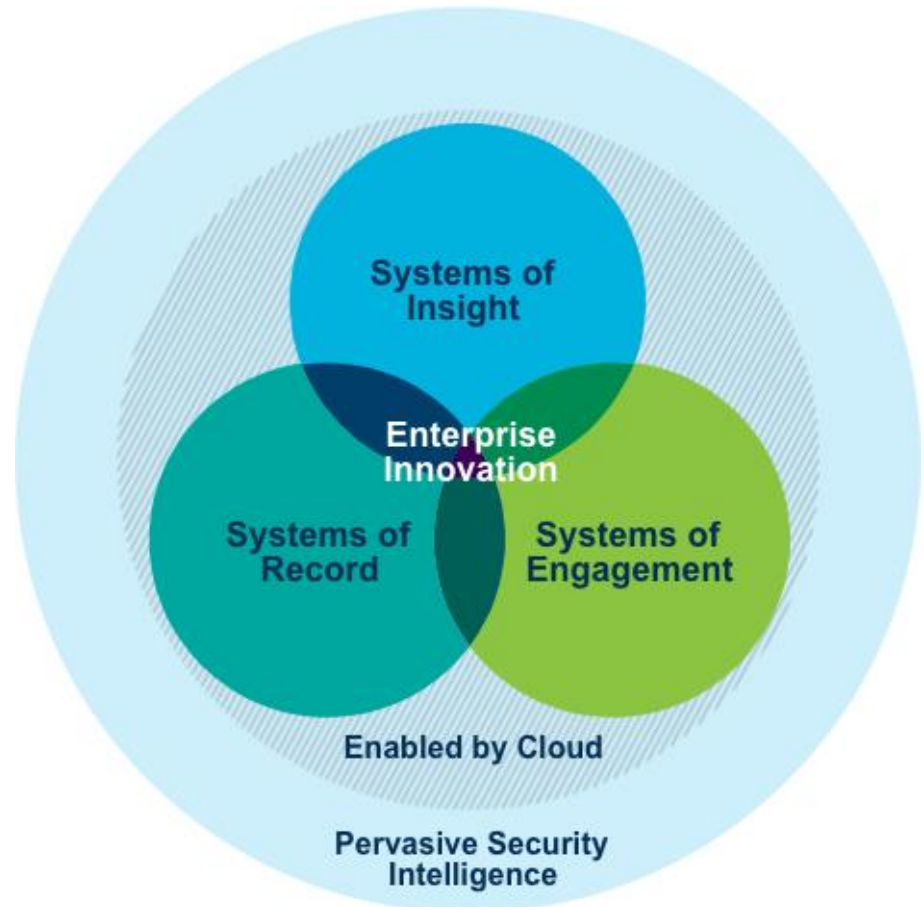

– Robert Darnell, M.D., Ph.D., CEO, President and Scientific Director of the New York Genome Center

Continued growth in the amount and complexity of medical knowledge – leverage Watson to scale expertise.

Recap: Systems of Insight – Knowledge-driven and Data-driven – shifting clinical decision support.
